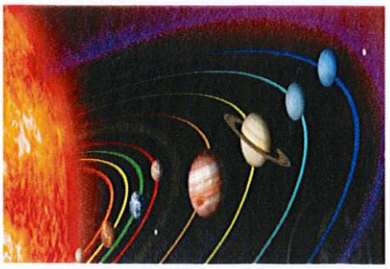
Compare and Contrast

Mercury and Pluto



Mercury is the second smallest of the nine planets in our solar system. It is also the nearest planet to the sun. Mercury spins very slowly. The side next to the sun gets very hot before it turns away from the sun. As the planet slowly spins, the frozen side then becomes burning hot and the hot side becomes freezing cold. Even though Mercury spins slowly, it orbits the sun very quickly. That is why it was named Mercury- after the Roman messenger for the gods.

Pluto is the planet farthest away from the sun. Pluto is so far away that it gets little of the sun's heat. That is why it is freezing cold on Pluto. Pluto is the smallest planet in the solar system. It is even smaller than Mercury. Some scientists think that Pluto was once one of Neptune's moons that escaped from orbit and drifted into space. Pluto is so far away from the sun that it takes 247 Earth years just to orbit the sun once.

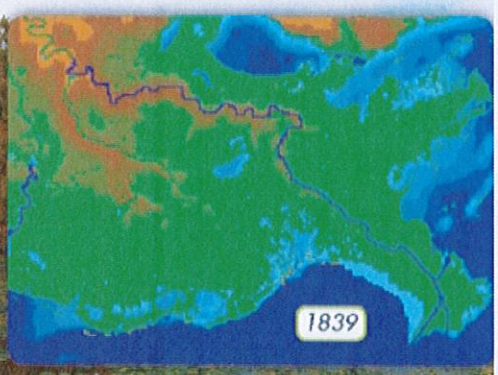
MY PLANET DIARY

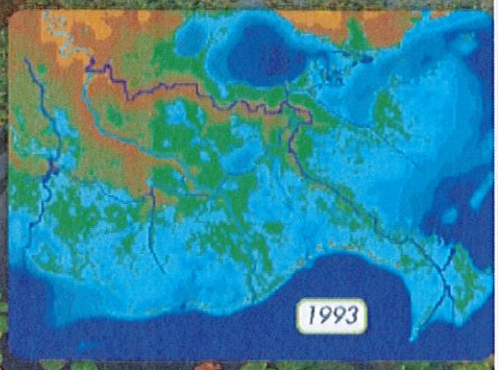
Connections

Wetlands once covered about 392 million acres (159 million hectares) in what is now the United States. Today, Alaska, Florida, Louisiana, Minnesota, and Texas have the most acres of wetlands. Alaska has lost little of its wetlands. But wetlands in many other states are disappearing. Consider Louisiana. The state loses areas of wetlands the size of a football field every 30 minutes!

You can use geography skills to understand how Louisiana's wetlands are changing. Look at the maps. The first map shows Louisiana's coast in 1839. The second map shows the same coast more than 150 years later. The green areas are areas of wetland. Notice the changes.

Draw on the 1993 map. Use a red pencil to show how you think the map would change if wetland loss continues.





My Planet Diary Response

Please answer the question with at least 3-5 sentences.

What is an Ecosystem?

A place for living things:

A living thing needs somewhere to call home or an **ENVIRONMENT**. A living things environment is everything around it. An environment has both **living** and **nonliving** parts.

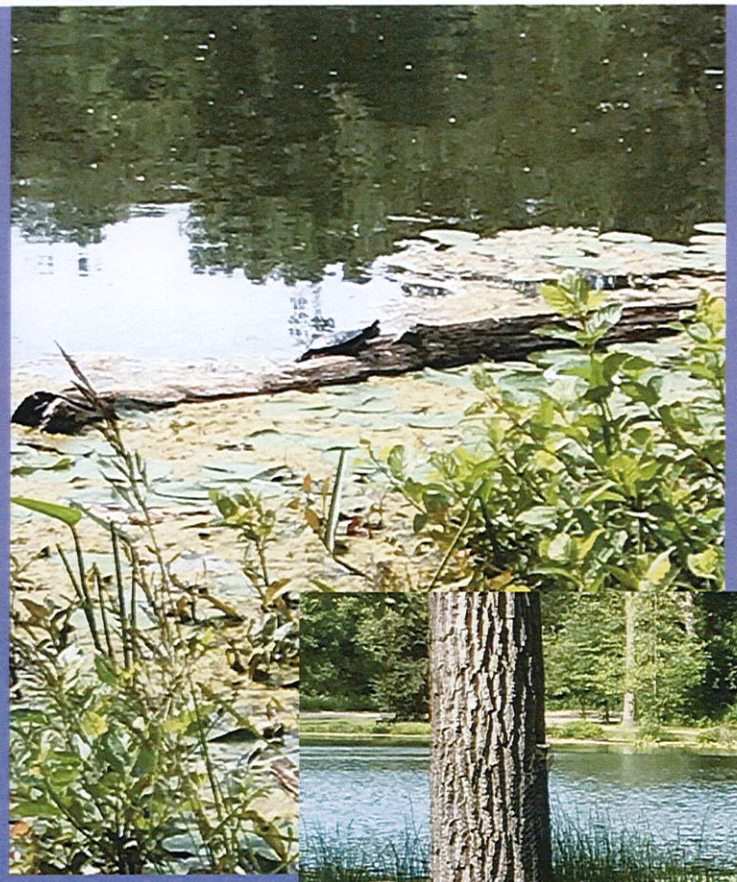
A **LIVING PART** in an environment includes plants, animals and other living things, like insects.

A **NONLIVING PART** in an environment is things like air, water, soil and temperature.

Parts of an Ecosystem:

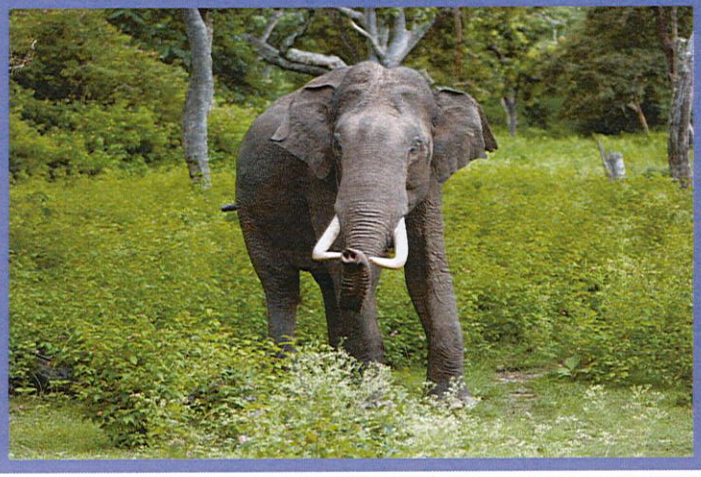
The living and nonliving parts of an environment interact. Interact means to act together. These interacting parts make up an **ECOSYSTEM**.

The living parts of an ecosystem depend on nonliving parts. For example, plants need sunlight, soil, air, and water to grow. The living parts also depend on one another. For example, animals eat other living things. Some animals use plants for shelter.



Habitats:

The place where a living thing makes its home is its **HABITAT**. A habitat has everything that a plant or animal needs to live. A habitat can be the water in a wetland. It can be the soil beneath a rock or even a crack in a sidewalk.



Groups within Ecosystems:

All the living things of the same kind that live in the same place make up a **POPULATION**. Populations can vary in size. Being a member of a population have different advantages, like being able to find more food or shelter.

All the populations that live in the same place make up a **COMMUNITY**. Populations in a community depend on each other.

Dear Aunt Rita,
Greeting:
A way to begin the letter
I had a wonderful time visiting you this summer. Swimming in your pool was a lot of fun. I liked your slide and playing Marco Polo with my cousins.
Thank you for taking me to the museum too. That was so thoughtful. I learned so much about the Revolutionary War. I wonder if I would be a Patriot or Loyalist?
Body:
